Interferons (IFNs) are proteins made and released by host cells in response to the presence of pathogens such as viruses, bacteria, parasites or tumor cells. They allow for communication between cells to trigger the protective defenses of the immune system that eradicate pathogens or tumors.

TYPES OF INTERFERON They are typically divided among two IFN classes based on the type of receptor through which they signal

They are mainly involved in innate immune response nonspecific defense mechanisms that come into play

immediately or within hours of an antigen's appearance in the body like chemicals in the blood, and immune system cells that attack foreign cells in the body against viral infection. The genes for these IFN- α molecules are found together in a cluster on chromosome 9.

It is produced by activated T lymphocytes and natural killer cells. They are responsible for stimulating the activity of macrophages and are therefore also known as macrophage activating factor
